Subject: Confirmation of the final text–table conflict codes (papers 93, 183, 289)

Dear Karim,

I have re-read the five papers that were coded as text–table conflicts before the recheck (papers 93, 180, 183, 194 and 289), and I agree with the final codes:

- Papers 180 and 194: conflict confirmed (a coefficient value in paper 180 and a coefficient sign in paper 194).
- Paper 93: no conflict. The two values differ only by rounding of the same value (0.0538 and 0.05375).
- Paper 183: no conflict. On re-reading, the conflict could not be confirmed.
- Paper 289: no conflict. The difference concerns AUC values, not a coefficient's sign or value or the number of genes or samples, so it is outside the item definition.

I also agree with the clarified definition: a coefficient value counts as conflicting only when the difference goes beyond rounding of the same value. With these codes, 2 of the 76 papers (2.6%) have a text–table conflict.

Best regards,

Moinul Islam
