Draft 5 (v2 results): notes for revision

Draft 5 (ManuscriptDraft5_v2.docx, 24 Oct 2026) replaces Draft 4. Framing chosen by the author: "shared signal, none validated". Built from the v2 outputs only (results/paper, results/numbers.csv); every decimal number was cross-checked against the v2 tables; all 50 references verified in PubMed (45) or standard non-PubMed sources (Holm 1979; Uno 2007 JASA; Viechtbauer 2010 JSS; Pustejovsky & Tipton 2018 JBES; survival package).

Title: "Published lncRNA prognostic signatures for lung adenocarcinoma share a modest transportable signal, but none is individually validated: a pre-registered benchmark". Abstract 316 words (structured); main text about 4,600 words; 5 tables (landscape section), 6 figures embedded under their legends, line numbers, double spacing.

Main changes from Draft 4: no "Replicated" signatures (Draft 4: Wu 2022, Yao 2021, Yu 2024); aggregate now Transportable (HR 1.27, 1.13-1.45; Draft 4: Inconclusive, 11 pairs); Yao 2021 pooled over five cohorts (1.41; HK 1.30-1.52; modified HK 1.17-1.68) instead of k = 2 / k = 4; CPTAC-3 205/55 (not 150/38); GSE81089 and GSE72094 added; Ensembl-based gene identity with overrides and successor IDs; H2 with stage + sex + age and Holm (not BH, not without age); raw-vs-refit divergence analysis dropped (not part of the registered v2 analyses); median follow-up by reverse KM.

To complete before submission (highlighted in the document): author list and affiliations; correspondence; PubMed search date and query (Supplementary File 1); PRISMA figure (v1 image; add the 76-paper extraction-record branch, verify counts); R and package versions (results/session_info.txt); repository URL and release tag (make public or archive with a DOI at submission); declarations (funding, competing interests, CRediT, acknowledgements); assemble Supplementary File 1 (docs/deviations_v2.md + search strategy + OSF updates); file OSF Update 4 (post-analysis disclosure, sections A-B of the deviations log).

Journal options (author to check current guidelines): Briefings in Bioinformatics (benchmarks of computational signatures), BMC Medicine (pre-registration and prediction-model methodology; structured abstract up to 350 words), Journal of Translational Medicine (translational oncology validation).
